AMD Catalyst Software Suite 11.2

AMD

Disponibile per il download l'ultima release dei driver AMD per schede video Radeon HD con controlli per la tessellazione.

AMD ha rilasciato la versione 11.2 WHQL della Catalyst Software Suite che introduce l'implementazione dei controlli per la tessellazione, oltre a tutti i miglioramenti sotto elencati:

Gaming performance improvements:

- Call of Duty:Black Ops: Performance increases up to 11% on ATI Radeon HD 5000 Series single card configurations with anisotropic filtering and anti-aliasing enabled.
- Batman Arkham Asylum:Performance increases up to 4% on ATI Radeon HD 5000 Series single configurations with anisotropic filtering and anti-aliasing disabled.

Catalyst AI Texture Filtering updates

- The Quality setting has now been improved to match the High Quality setting in all respects but one;it enables an optimization that limits tri-linear anisotropic filtering to areas surrounding texture mipmap level transitions,while doing bilinear anisotropic filtering elsewhere.This optimization offers a way to improve filtering performance without visibly affecting image quality.
- The Performance setting has been updated to address the sharpness of the default Quality setting causing shimmering in certain cases.It now provides a smoother filtering option that eliminates most shimmering while preserving the improved detail provided by anisotropic filtering.

Tessellation Controls

- Supported on the ATI Radeon HD 5000 Series and the AMD Radeon HD 6000 Series
- New settings give users full control over the Tessellation levels used in applications.
- Morphological Anti-Aliasing support for the ATI Radeon HD 5000 Series

Support Video Quality settings during Blu-ray 3D playback

- Supported on the AMD Radeon HD 6000 Series
- Requires Blu-ray 3D player software, 3D supported display and 3D Stereoscopic glasses
- Users can now enable the Video Quality settings within the Catalyst Control Center when playing Blu-ray 3D content
